																																217-456-505	168	49	288	49,476	197,904	395,808	239	✓																																						
																																696-697-985	408	288	289	242556	970224	1940448	1																																							
																																220-459-509	170	50	289	50,490	201,960	403,920	239																																							
The larger <i>s</i> or <i>t</i> of the BLUE becomes the <i>s, t</i> values of the MIDDLE RED : for the 5-12-13 PPT, the larger <i>t</i> =8 becomes the <i>s</i> -value of MIDDLE RED , for the 8-15-17 PPT, the larger <i>t</i> =9 becomes the <i>t</i> -value of MIDDLE RED . The MIDDLE RED 20-21-29 PPT has <i>r</i> = 12, <i>s</i> = 8 and <i>t</i> = 9 values, so $a = r+s = 12+8 = 20$ $b = r+t = 12+9 = 21$ $c = r+s+t = 12+8+9 = 29$ giving the MIDDLE RED 20-21-29 PPT Branch . The <i>f</i> -value as $f = b - a = 21 - 20 = 1$																																																																														
The sum, Σ , of 3-4-5 = 12 and becomes the <i>r</i> -value of MIDDLE RED The sum, Σ , of 20-21-29 = 70 and becomes the <i>r</i> -value of MIDDLE RED The sum, Σ , of 119-120-169 = 408 and becomes the <i>r</i> -value of MIDDLE RED																																																																														
The larger <i>s</i> or <i>t</i> of the BLUE becomes the <i>s, t</i> values of the MIDDLE RED : for the 5-12-13 PPT, the larger <i>t</i> =8 becomes the <i>s</i> -value of MIDDLE RED , for the 8-15-17 PPT, the larger <i>t</i> =9 becomes the <i>t</i> -value of MIDDLE RED . The MIDDLE RED 20-21-29 PPT has <i>r</i> = 12, <i>s</i> = 8 and <i>t</i> = 9 values, so $a = r+s = 12+8 = 20$ $b = r+t = 12+9 = 21$ $c = r+s+t = 12+8+9 = 29$ giving the MIDDLE RED 20-21-29 PPT Branch . The <i>f</i> -value as $f = b - a = 21 - 20 = 1$																																																																														

Key: PPT=Primitive Pythagorean Triple; *r*=even # such that $r^2/2=st$ where *s, t* are Factor Pairs; A=Area; 4A=4Area; 8A=8Area; $f=b-a$ & $f^2=(b-a)^2$, as $a^2 + b^2 = c^2 = 4A + f^2 = (8A + f^2) - 4A$

Table 2c The Tree of Pythagorean Triples branches from the 3-4-5 PPT trunk first into a 3-part main branch, each of which further branches into 2nd, 3rd, 4th, ..., tertiary branches. Each tertiary follows the lead *f*-value of its predecessor, but is actually formed as an intermediary to the upper and lower branches of which it is a part. All PPTs — with no repeats — are to be found. *Pythagoras* first discovered the UPPER branch sequence, *Plato* (a century later) discovered the LOWER branch sequence. The MIDDLE branch sequence follows as an intermediary, hybrid sequence of the UPPER and LOWER.

Using the *Expanded Dickson Method* on the **BBS-ISL Matrix**, every PPT branch is accounted for by the previous branch. This is done by enlisting the *r, s, t, A, 4A, 8A, f* associated values. All these values are derived directly from the respective PPT by both algebra and geometry. In **Table 2a** we looked at the overall. In **Table 2b**, we examine how the UPPER and LOWER branches (blue) are made from the trunk (red). In **Table 2c**, we see how the MIDDLE branch (red) is formed from the UPPER and LOWER (blue) branches and the trunk (red). As a *fractal*, this **Number Pattern Sequence** that defines the first branchings, continues through the entire tree. **Table 2d** shows BLUE branching to 2nd Tertiary Branches. **Table 2e** reveals the power of *f*. **Table 2f** tells all.
